

Work this week has been going great! During the meeting with Hugo, he explained how everything in the backend worked which made me able to work much more independently this week. I got a grasp on how things worked and were connected so that even I could help team members. I contributed to the deliverables this week by completing user story 3.25 which included both frontend and backend implementation. During the meeting with Hugo we also managed to resolve the issue with my IDE. That was also an enabler for being able to complete the work for this week's sprint.

This week I also talked to the stakeholders and showed them our progress. I also had some questions the team wanted an answer to which I asked the stakeholders. The stakeholders were happy with what we had accomplished thus far which was nice to hear. This also meant that we as a team did not have to change our plan for this week's sprint and could instead focus on completing the last couple of things for the app.

As this is the last individual reflection I thought that I might go back to my reflections from the first couple of week's and evaluate what I have accomplished:

A big focus of mine in the beginning was learning and mastering Scrum, both by myself and with the team. I feel that I have accomplished that. We as a team have really made it work and I feel confident in working with Scrum.

I also had a goal to soak up as much knowledge as possible from my teammates. My approach for this might not have been optimal as I have asked many small questions rather than setting up a meeting to get an overview of all small parts. This approach made it so that I couldn't work as efficiently as I would have liked sometimes. I also used YouTube as a source of knowledge a lot during sprints. Through that I have learnt many new things.

As I have been working a lot from distance, I feel that I haven't had a chance to develop my leadership skills as much as I would have wanted to. It is quite hard to lead a meeting from Zoom when the rest of the team is there at site. However, I have not made an attempt to develop these skills through writing actions during my sprint reflections. Looking back, I maybe should have changed my learning objective to something else that I could work on more actively. This is something I will bring with me to future projects; constantly checking in on my learning objectives that I set in the beginning to make sure that I develop the skills I want to develop.
