

This week we started our first sprint with a sprint planning meeting where we finished filling our product backlog and chose which user stories we would work on this week. During the weekend I had watched some videos of how to write (split the cake) and split user stories. Therefore I proposed that we rewrite some of the user stories that needed rewriting to correctly split the cake. I think that we managed to do this well but we have also tweaked some of them during the week which I as PO have felt been necessary.

Previous weeks I have felt that I didn't have sufficient knowledge of scrum but I feel that I am starting to grasp the concept more and more as we start applying it in reality. My goal for the next sprint however is to learn more about how to efficiently estimate our velocity and effort at the beginning of sprints. I thought that this was difficult this sprint and think that it can be performed better in the future. My plan is to watch YouTube videos about the subject as this has worked well previously. Hopefully I can use this knowledge to help us as a team to work more efficiently.

I have not committed that much to our repo this week which is something I want to change next week. Therefore I have read up on HTML so that I will be able to work on our front-end. I have only covered the basics so far so the next step is to go a little more in depth plus learn about CSS. My main source of knowledge will once again be YouTube.
