

During this second week I have continued to learn about Scrum, more specifically about my role as Product Owner and how I can add value to the team during the planning phase. I was in continuous contact with our stakeholders during the week so that I could present epics for the team that covered the whole product specification. I think that I managed to do that well. However, in last week's reflection I stated that I wanted our product backlog to be complete. That turned out to be an overoptimistic goal. Due to my lack of knowledge in Scrum I didn't know how difficult and time consuming it would be to specify good user stories. Therefore, in the future I will try to set less ambitious goals when I face challenges that I previously have not encountered.

This week we as a team acknowledged that only us "Industriell Ekonomi" students in the group have taken a database course. Thus, we have decided that we will have the main responsibility over designing our data management system. As we want the whole team to have knowledge about the whole product and how it works, we might have to teach the rest of the team about some database specific concepts.

As stated, this week I have contributed to our use of Scrum through filling up our Trello board. I have been writing epics so that we can produce a product backlog that enables us to create as much value for our stakeholders as possible. Furthermore we decided in the team that I shouldn't be product owner and Scrummaster. Till next week's reflection I want to learn more about how to create good user stories and how to "split the cake", as I thought this was a big challenge this week. To learn this my main source of information will be youtube as I have found that there are a lot of good videos about Scrum on the platform.
