What do I want to learn or understand better?
This week I got a slightly better understanding of how to make a good user story. Now they are not as vague and we have more defined DoD. However they can always get better and so I will keep trying to learn and understand how to construct good user stories, epics and sprint goals.

The end of last sprint, I mentioned that I wanted to learn how to apply the database but that has not happened this sprint because I took the responsibility of doing a user story on the frontend. The specific user story does not currently depend on databases. It made me realize that I want to learn how to use React and tailwind css so that I can contribute on many sides of the application and get a more complete picture. Also ran into some issues with a user story that made me want to learn so that I can contribute with user stories of different types. To do this I will continue to work with user stories of this kind as well as other types of user stories in order to get experience. During my work I will use internet resources as well as team members who have worked with this previously to find the necessary knowledge to complete my tasks.

How can I help someone else, or the entire team, to learn something new?
I have used my knowledge of SQL to assist when teammates working on database-related user stories have met difficulties. I have also provided resources necessary to work with SQL and databases. This is something I hope to continue doing as well as providing assistance to more types of problems in other areas as I get more knowledgeable about frameworks such as React.

What is my contribution towards the team's use of Scrum?
As the scrum master, I have continued to make sure that Scrum is being followed and have contributed to every meeting that we've had. An example is that I've led most of the daily scrum meetings that we've had this sprint. I've also led parts of our team reflection meeting and will most likely continue to do. I have notified when certain parts of our work process needs to be done such as team members participating in giving data for our KPIs.

What is my contribution towards the team's deliveries?
As mentioned before, even though I wanted to contribute more within databases and SQL I instead worked on the frontend and so my wish from last sprint is not fulfilled this time but it still remains as a deliverable that I want to contribute in the future sprints ahead. This week I have tried to create a new view on the frontend of our application but ran into some issues that I want to fix before the next sprint. Therefore this also increases my motivation to learn what and where I did things wrong so that I can continue to contribute better within this area of the project. Next sprint I want to be able to contribute to a deliverable regardless of what part of the project it is about so that I can keep getting an all-around knowledge base about our project and how it works. It is also so that I can contribute and ease the burden of team members who currently might be the only one knowledgeable about a certain field and have been getting tasks of a specific part during our sprints.
