During this week I have further learned about the course content and working with Scrum. We also managed to specify our project and scope better and have made a product backlog that will cover one to three weeks worth of work. Our team overestimated the creation of the backlog where last week I wanted to have a fully made product backlog. This is probably due to optimism and lack of knowledge on how to create good user stories, making it more time consuming than expected.

This week we also decided to switch Scrum master so that I am currently the new scrum master. This decision was based on the fact that maybe it was not an interesting idea to have one team member be both scrum master and product owner. We also decided as a team that members from "Industriell Ekonomi" will be in charge of designing our database. This is because we have recently had a database course and we are in a better position to have more responsibility and can teach the entire team about how it works.

I have contributed this week by actively engaging in all meetings and been a part of filling up our Trello board. I have written and modified user stories and epics together with the team.

Next week I want to continue learning about how to act as a scrum master but also how to create good user stories and "splitting the cake" vertically as I found that to be a challenge that I want to get better at. The way to tackle this will be with the help of supervision and online resources about Scrum. I also want to have started creating a database that suits our current needs. Learning from last week, This time I will try to underestimate the amount that will be done and assume that I will have made a database domain, ER-diagram and translated the diagram to a schema.
