Now that the project work has come to an end when it comes to our product, I feel like I have I have learned a lot when it comes to web development, getting some grasp on how react and frontend works generally as well as how it communicates to a server. However, using Scrum is what has been the most educational. For the first time in university a project has somewhat been like I imagine it might work in work life.

Next week everything will wrap up and I hope listening to the experiences of the other group members will give insight into how other people have viewed the project. This is something I could bring into later projects and maybe even work life, where group dynamics is one of the most important aspects.

My contribution to the teams use of scrum has remained the same and while it would have been interesting to try out some of the roles of PO and Scrum Master, it is not something I have requested or feel I have been missing.

The last week I worked on getting editing events on the app working on the frontend.
